

Samir Benali

Backend Developer

samir.benali@example.com

+212 600 123 456

Rabat, Morocco

Profile

Backend developer with seven years of experience building reliable PHP and Laravel applications for small product teams. I care about readable code, careful database design and automated tests, and I like working closely with designers, support staff and product owners to turn customer feedback into features that people actually use. I am looking for a role where I can keep improving an existing product and help junior developers grow.

Work Experience

Backend Developer, Atlas Commerce, Rabat

Mar 2022 – Present

Online retailer selling home goods across Morocco through a web shop, a mobile app and partner stores. I joined as the second backend developer in a team of eight.

- Built a RESTful API in Laravel that serves the mobile shopping app and the partner portal, with versioned endpoints and clear error messages for the client teams.
- Reduced average checkout response time by 40% by rewriting slow MySQL queries, adding missing indexes and caching the product catalogue between requests.
- Introduced continuous integration with GitHub Actions so that every pull request runs PHPUnit, coding style checks and static analysis before review.
- Moved local development to Docker, which removed recurring setup problems and cut the setup time for new team members from 3 days to one morning.

PHP Developer, Medina Digital, Casablanca

Jun 2019 – Feb 2022

Software agency building management tools for clinics, schools and local service companies. Most projects were delivered by teams of two or three developers.

- Developed the booking and invoicing modules of a clinic management platform used daily by private doctors and their reception staff.
- Wrote PHPUnit tests for the billing code and raised its coverage from 35% to 80%, which made monthly releases much calmer for the whole team.
- Created admin screens in Vue that let support agents refund orders, correct invoices and update customer records without asking a developer.

Junior Web Developer, Sahara Studio, Marrakesh

Sep 2017 – May 2019

Small studio designing and hosting websites for hotels, restaurants and tour operators, where I learned to support real customers directly.

- Maintained client websites for hotels and restaurants and fixed reported bugs within the support deadlines agreed with each customer.
- Automated the weekly report exports for account managers, saving them 6 hours of manual spreadsheet work every week.
- Documented deployment steps, server access and database backups so that other developers could release changes safely when I was away.

Education

Bachelor of Science in Computer Science, Mohammed V University, Rabat

Sep 2014 – Jun 2017

Final project: a room reservation system for the faculty library, built with PHP and MySQL and used by

students during my final year.
